Abstract:	Beef has an important role in the health of the body. Food safety and halal are the main factors for consumers in purchasing beef. However, in reality, several activities in the beef supply chain result in status changes to be unsafe and not halal for consumption. This occurs due to weak food safety and halal supervision in the beef supply chain system. Therefore, this study proposes the use of blockchain technology to strengthen the food safety and halal supervision system in the beef supply chain. The objectives of this study are (1) to identify food safety and halal risk factors, and (2) to develop a blockchain technology design for mitigating food safety and halal risks in the beef supply chain. This research uses the FMEA method to measure risks and FTA for risk analysis. The results showed that 30 risks were identified in the beef supply chain. The highest risk is the absence of a halal certificate on the product. The 30 risks are grouped into 4 risks that are included in extreme priority risk, 11 risks in high priority risk, 4 risks in moderate risk, and 11 risks as acceptable risk. Based on these results, the role of blockchain technology to minimize risk is in the flow of data, and transactions will be easier to track, more transparent, and safer to use as part of the control and supervision system for food safety and halal standards in the beef supply chain. This research has implications for transparency in the supply chain, the accuracy of product track records, prevention of food poisoning, improving halal compliance, risk management and thus increasing consumer confidence.

Blockchain Technology Design Based on Food Safety and Halal Risk Analysis in the Beef Supply Chain with FMEA-FTA

Dear Dr Wahyuni,

Thank you for submitting your manuscript to Journal of Engineering Research.

I have completed my evaluation of your manuscript. The reviewers recommend reconsideration of your manuscript following major revision. I invite you to resubmit your manuscript after addressing the comments below. Please resubmit your revised manuscript by Feb 11, 2024.

When revising your manuscript, please consider all issues mentioned in the reviewers' comments carefully: please outline every change made in response to their comments and provide suitable rebuttals for any comments not addressed. Please note that your revised submission may need to be re-reviewed.

To submit your revised manuscript, please log in as an author at <https://www.editorialmanager.com/jer/>, and navigate to the "Submissions Needing Revision" folder.

Research Elements (optional)

This journal encourages you to share research objects - including your raw data, methods, protocols, software, hardware and more – which support your original research article in a Research Elements journal. Research Elements are open access, multidisciplinary, peer-reviewed journals which make the objects associated with your research more discoverable, trustworthy and promote replicability and reproducibility. As open access journals, there may be an Article Publishing Charge if your paper is accepted for publication. Find out more about the Research Elements journals at https://www.elsevier.com/authors/tools-and-resources/research-elements-journals?dgcid=ec_em_research_elements_email.

Journal of Engineering Research values your contribution and I look forward to receiving your revised manuscript.

Kind regards,
Jisha Sara
Assistant Managing Editor
Journal of Engineering Research

Editor and Reviewer comments:

Reviewer 1: I see the article contribute to the literature by implementing the FMEA analysis to measure the risks and FTA. Then the RPN is computed for every risk which is the novel part of this article.

My comment would be only on why not mentioning references on the halal food supply chain using blockchain? I see a number of references study the same topic. You should revise the literature review part and highlight the gap in the research so you can define the research gap and your research scope very well to highlight your main contribution.

Reviewer 2: Firstly, I would like to commend you on the overall quality and clarity of your manuscript. Your approach to addressing the critical issue of food safety and halalness in the beef supply chain using blockchain technology is both timely and significant.

However, after a thorough review, I believe the paper could benefit from some minor and major revisions. Suggested revisions are as follows:

- 1- In the introduction, provide some statistics about the prevalence of the problems in halal beef supply chain. Convince the reader that the problem is relevant.
- 2- Elaborate on how you determined the risk factors in the first step of your methodology. The role of the experts was only to validate the risk factors; but you should expand on how you came up with the risks in the first place.
- 3- In table 2, sort the risks in descending order based on the RPN within each actor for better readability. Also make sure you fix the typo in the first column title "Aktor"
- 4- (MAJOR) You gave sufficient theoretical foundation regarding risk analysis tools which is good. However, there is a major lack of theoretical foundation and literature review about blockchain technology in food supply chain management in general, and in halal beef supply chain in particular. If there's a gap in the literature regarding halal beef SC, then you should highlight it. Otherwise, you should outline what others have done in this area and how your work will contribute to the literature.
- 5- (MAJOR) While you have thoroughly identified the risk factors in halal beef supply chains, the paper requires a more in-depth exploration of the specific blockchain architecture proposed. Details such as the type of blockchain (public/private/hybrid), consensus mechanisms, and data storage strategies would be invaluable. This

technical depth is essential for assessing the feasibility and practical implementation of your proposal.

In conclusion, the paper tackles a really interesting and pertinent subject. The changes suggested above are meant to strengthen your points, making your study more all-encompassing, and useful in real-world scenarios.

ABSTRACT

Beef has an important role in the health of the body. Food safety and halal are the main factors for consumers in purchasing beef. However, in reality, several activities in the beef supply chain result in status changes to be unsafe and not halal for consumption. This occurs due to weak food safety and halal supervision in the beef supply chain system. Therefore, this study proposes the use of blockchain technology to strengthen the food safety and halal supervision system in the beef supply chain. The objectives of this study are (1) to identify food safety and halal risk factors, and (2) to develop a blockchain technology design for mitigating food safety and halal risks in the beef supply chain. This research uses the FMEA method to measure risks and FTA for risk analysis. The results showed that 30 risks were identified in the beef supply chain. The highest risk is the absence of a halal certificate on the product. The 30 risks are grouped into 4 risks that are included in extreme priority risk, 11 risks in high priority risk, 4 risks in moderate risk, and 11 risks as acceptable risk. Based on these results, the role of blockchain technology to minimize risk is in the flow of data, and transactions will be easier to track, more transparent, and safer to use as part of the control and supervision system for food safety and halal standards in the beef supply chain. This research has implications for transparency in the supply chain, the accuracy of product track records, prevention of food poisoning, improving halal compliance, risk management and thus increasing consumer confidence.

Keywords: Halal, food safety, beef supply chain, blockchain technology

INTRODUCTION

The beef industry plays an important role in the global food supply chain. This is because beef, as a ruminant commodity, is a source of protein that influences the development of human health. As the world's population increases, a 76% increase in global meat consumption is expected between 2015 and 2025 (Thomas et al., 2021). In its development, consumer demand for beef is not only related to the amount needed but also to the fulfillment of food safety and halal standards. Food safety and halal are important aspects to ensure that the beef consumed is safe, and follows Islamic law. Fulfillment of these two things is a major consideration for consumers in choosing food for health reasons and compliance with values in Islam (Hana Catur Wahyuni et al., 2020). Food safety standards regulated through national and international policies are an important component of preparing food that is safe for consumption, avoiding potential chemical, biological, and physical risks that can endanger the health of the consumer's body (Liu et al., 2022). Halal is an obligation for adherents of Islam for all products consumed, under the provisions in the Quran and Hadith (Fuseini et al., 2016) (Khan et al., 2018).

However, some phenomena indicate that there are activities that result in food safety and halal contamination in the beef industry supply chain. This happens because the beef industry supply chain is more complex than other food industries. Food safety and halal contamination in the beef industry supply chain results in unsafe and un-halal food for consumption. Food safety contamination can come from the use of raw materials that contain harmful enzymes and ethanol (Ermis, 2017), working mechanism in the production room and product storage (Britton et al., 2021), suppliers, distributors, and retailers (H.C. Wahyuni et al., 2018). Halal contamination can come from cross-contamination with halal and non-halal products in warehouses, logistics, equipment used, or production areas that are not separate for halal and non-halal products, the use of raw materials, or additives that have not been certified.

1 Assurance of the fulfillment of food safety and halal standards is carried out by
2
3 avoiding the occurrence of such contamination through the implementation of risk
4
5 management. In various studies, it has been proven that risk management can identify and
6
7 manage risks and develop risk mitigation actions to formulate areas of improvement in
8
9 reducing hazards in the supply chain to improve company performance (Minguito & Banluta,
10
11 2023). Specifically in the case of food supply chains, previous research suggests that risk
12
13 management has a positive impact on environmental health through cooperation between
14
15 suppliers and customers in terms of design, purchasing, production, packaging, and the use of
16
17 green energy (El Ayoubi & Radmehr, 2023).
18
19
20
21

22 However, in reality, there are problems in the meat supply chain as one of the ruminant
23
24 commodities related to the implementation of food safety and halal standards and have an
25
26 impact on the risk of changing the status of food to be unsafe and not halal. Lack of information
27
28 in the beef supply chain, especially related to the health of livestock (cattle), processing and
29
30 slaughtering, transport, and storage systems are potential sources of contamination so that
31
32 products become unsafe and not halal for consumption.
33
34
35

36 Therefore, implementing risk management in the beef supply chain to comply with
37
38 food safety and halal standards requires cooperation between actors in a holistic and integrated
39
40 manner by utilizing technology. Blockchain technology is the best option that can be used in
41
42 risk management in the beef supply chain to meet food safety and halal standards because it
43
44 can guarantee resilience, transparency, and accountability in the risk management decision-
45
46 making process to respond to uncertain and complex events to support the improvement of
47
48 supply chain performance (Chowdhury et al., 2023; Hu & Ghadimi, 2022; Sheel & Nath,
49
50 2019).
51
52
53

54 This research offers a novelty in the form of a blockchain technology model following
55
56 food safety and halal standards in the beef supply chain. This research is important to overcome
57
58 the weak control and supervision system of food safety and halal standards in the beef supply
59
60
61
62
63
64
65

1 chain. With the results of this research, the flow of data and transaction information will be
2 more effective and efficient to be traced, transparent, and secured as a source of control and
3 supervision system for food safety and halal standards in the beef supply chain. With this
4 technology, it is expected that the availability of beef that meets food safety and halal standards
5 can be guaranteed, thereby reducing the value of imports as has been the case. Based on this
6 description, the research objectives are: (1) identify risk factors for food safety and halal, (2)
7 Develop a blockchain technology design for mitigating food safety and halal risks in beef.

18 **FOOD SAFETY**

19 Food safety means keeping food from becoming contaminated, spoiled, or other health
20 threats during production, processing, distribution, storage, and consumption. Food safety is
21 becoming a topic of increasing interest, and in recent years, research on the subject has grown
22 rapidly (Kuai, 2023). Chemical and microbial contamination, adulteration, mislabelling, and
23 expired food are some of the food safety hazards that occur in food markets (Gizaw, 2019).
24 One important measure to stop foodborne illness is food safety inspections, which have been
25 criticized for being inconsistent and not adequately solving the problem (Barnes et al., 2022).
26 Deliberate food crime, which covers a wide range of types and levels of financial gain, requires
27 robust risk assessment and countermeasure tools (Manning & Soon, 2016).

41 **HALAL**

42 "Halal" is an Arabic term that means "permissible" or "sharia-compliant". In food and
43 beverages, the term is used to refer to items or ingredients that are permitted or halal for
44 consumption by Muslims. The rejection of alcohol and pork, as well as certain slaughtering
45 techniques, are some examples of the differences between halal and non-halal food (Jia &
46 Chaozhi, 2021). In Islam, the consumption of pork, carrion, blood, all blood derivatives,
47 alcohol, and all ingredients that are considered haram or impermissible is prohibited.
48 Conversely, foods that do not contain these ingredients are called halal (Karahalil, 2020). To
49 compete in the global Halal market, investment in Halal food production in developing

1 countries and non-Muslim countries requires the adoption of complex and advanced food
2 technologies (Mahama et al., 2020).
3
4

5 6 **RISK ANALYSIS**

7
8 Risk analysis is a systematic process for identifying, assessing, and managing potential
9 risks or uncertainties that may affect the achievement of project objectives, business decisions,
10 or other activities. Risk analysis is used in the field of occupational health and safety to identify
11 and control risks in laboratory research. This includes training, creating emergency plans, and
12 ensuring the proper use and storage of chemicals (KARAHAN & AYDOĞMUŞ, 2023).
13

15
16
17
18
19

20 **BEEF SUPPLY CHAIN**

21
22 The beef supply chain involves the flow of products, financial transactions, and
23 information among the various actors involved. Highly technical, professional, and
24 competitive livestock production, mainly based on quality and technology, will lead to global
25 progress in the supply chain (Malafaia et al., 2021). Supply chain governance encompasses
26 the rules, regulations, and organizations that govern the supply chain to achieve various
27 objectives, including environmental objectives, to maintain the sustainability of the industry
28 (Chamanara et al., 2023).
29
30
31
32
33
34
35
36
37
38

39 **FMEA**

40
41 A systematic method known as FMEA (Failure Mode and Effect Analysis) is used to identify,
42 evaluate, and manage possible failures in a process or product. FMEA uses expert data to
43 determine the risk of failure modes (Emovon & Mgbemena, 2019). In industries such as
44 manufacturing, healthcare, and aerospace, FMEA is commonly used to improve product
45 quality, reliability, and safety. The FMEA process includes identifying potential failure modes,
46 determining their causes and effects, and assigning a risk priority number (RPN) to each failure
47 mode based on severity, occurrence, and detectability (Zhou et al., 2022). The RPN is
48 calculated by multiplying the severity, occurrence, and detectability scores for each failure
49 mode. A higher RPN score indicates that the failure mode poses a greater risk. FMEA can be
50
51
52
53
54
55
56
57

59
60
61
62
63
64
65

used independently or in combination with root cause analysis (RCA) and fault stem analysis (FTA) to improve the reliability and safety of a system or product (Ouyang et al., 2022).

FAULT TREE ANALYSIS (FTA)

A graphical and analytical tool called Fault Tree Analysis (FTA) is used to evaluate potential causes of system failure. This tool is commonly used in many fields, such as engineering, safety, and risk management. FTA starts with a critical event, such as a system failure, and then identifies all the factors that could have contributed to the event. A tree-like structure shows these causes, with the main event at the top of the tree and potential causes branching out below it. To improve the efficiency of recursive failure analysis, FTA is often used in conjunction with other methods such as FMEA (Failure Mode and Effects Analysis) (Peeters et al., 2018). FTA also uses fuzzy logic and ontology-based approaches to perform comprehensive analyses that are based on rich domain knowledge and in a fuzzy environment (Akyuz et al., 2020). FTA can help find and prioritize risks and create safety protocols to prevent or mitigate failures (Pan et al., 2022).

METHODS

This research was conducted on the beef supply chain in East Java, Indonesia. The structures involved in the beef supply chain are farmers as cattle suppliers, beef processing companies, transporters, and distributors/retailers. The stages of research implementation were carried out in the following stages:

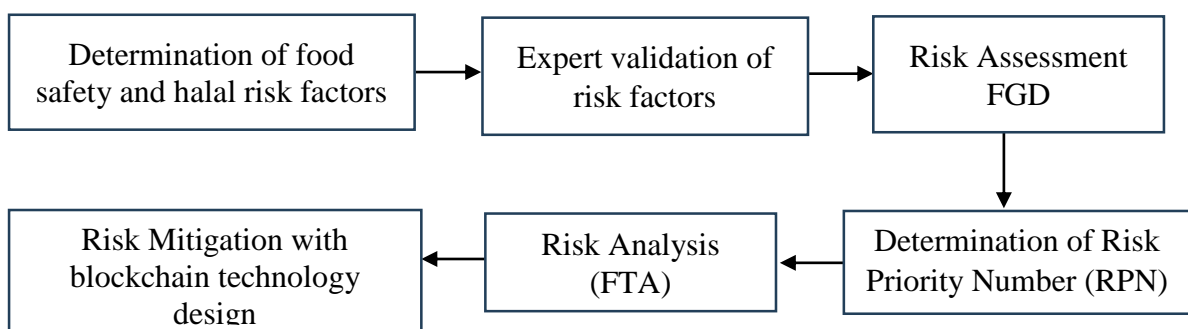

Figure 1: Research Stages

The experts involved in the validation and risk assessment were 7 people from academia, practitioners, and government. Risk factors in the beef supply chain were formulated based on food safety and halal risks.

Table 1. Risk factors on food safety and halal in the beef supply chain

Supply Chain Actors	Risk Factor	Risk Code
Supplier	No animal health data yet	R1
	Transmission of disease from cattle to humans	R2
	Physical damage	R3
	Foreign body contamination such as glass, plastic, or metal	R4
	Residual drug or chemical content	R5
	Chemical or heavy metal contamination	R6
	Unhygienic storage	R7
	Unhygienic transport	R8
	No traceability of animal origin	R9
	Misinformation	R10
	Does not have a halal certificate	R11
	The process of slaughtering cattle does not follow Islamic law	R12
	Cross-contamination with non-halal meat in storage or transport	R13
Production System	Cross-contamination of equipment used with non-halal products	R14
	Contamination using unhygienic equipment	R15
	Use of food additives that are not halal-certified	R16
	Use of food additives or preservatives that are not suitable for human health	R17
	Production room temperature is not up to standard	R18
	Products not yet halal-certified	R19
	Physical contamination of product packaging	R20
Distribution System	The storage warehouse is not halal-certified	R21
	Cross-contamination with non-halal products	R22
	Use of unhygienic modes of transport	R23
	No temperature control during the transport process	R24
	Storage room temperature is not suitable	R25
	Cross-contamination with other products in the storage room	R26
	Subscription of unhygienic products	R27
	Subscription of halal-contaminated products	R28
	No record of product expiry yet	R29
There is no inspection of the halal status of the product	R30	

This activity is carried out by experts by filling out a questionnaire based on aspects, namely: O (Occurance), S (Severity), and D (Detection). Occurrence indicates the frequency of errors or failures. Severity indicates the severity of the impact of an error/failure. Detection describes the effectiveness of the detection system to detect errors or failures that will occur. This assessment refers to the mechanism in the FMEA (Failure Mode Effect Analysis) method (Salah et al., 2023). The RPN value is obtained based on the following equation:

$$RPN = S \times O \times D$$

The RPN value is then classified into priority levels as in the following (Haider et al., 2021). The higher the RPN value, the higher the risk level for that factor so it becomes a priority that must be mitigated. Risk prioritization is done by arranging the RPN values from highest to lowest as the first to last priority. S, O, and D risk assessments were conducted by experts through FGDs. In the FGD, all experts discussed and agreed to provide an assessment as shown in Table 4 below:

Table 2. Supply Chain Risk Assessment

Aktor	Risk	S	O	D	RPN	Risk Priority Level
Supplier	R1	6	7	7	294	High priority risk
	R2	7	4	6	168	Moderate priority risk
	R3	3	4	7	84	Acceptable risk
	R4	7	2	7	98	Acceptable risk
	R5	7	2	8	112	Acceptable risk
	R6	7	3	6	126	Acceptable risk
	R7	6	6	7	252	High priority risk
	R8	7	7	8	392	High priority risk
	R9	5	6	3	150	Moderate priority risk
	R10	3	5	3	45	Acceptable risk
	R11	8	7	8	448	Extreme priority risk
	R12	7	4	5	140	Acceptable risk
	R13	3	2	5	30	Acceptable risk
Production system	R14	7	3	7	147	Acceptable risk
	R15	7	5	8	280	High priority risk
	R16	6	8	8	384	High priority risk
	R17	5	8	8	320	High priority risk
	R18	8	3	8	192	Moderate priority risk
	R19	8	8	8	512	Extreme priority risk

	R20	3	3	6	54	Acceptable risk
Distribution system	R21	8	8	8	512	Extreme priority risk
	R22	7	6	8	336	High priority risk
	R23	3	5	7	105	Acceptable risk
	R24	6	6	7	252	High priority risk
	R25	3	3	5	45	Acceptable risk
	R26	5	5	7	175	Moderate priority risk
	R27	6	6	7	252	High priority risk
	R28	8	4	8	256	High priority risk
	R29	8	6	8	384	High priority risk
	R30	7	8	9	504	Extreme priority risk

Each RPN (table 1) value is classified into critical risk, high risk, moderate risk, and minor risk. Extreme priority risk is the most critical risk that affects the safe and halal status of beef. Therefore, the four risk factors must be further analyzed to obtain information about the root of the problem so that a solution can be formulated. In this study, risk analysis was carried out using FTA (Fault Tree Analysis). The FTA design in this study was prepared for extreme priority risk and high priority risk levels. Moderate risk and acceptable risk levels can be controlled through corrective actions carried out periodically by utilizing existing resources.

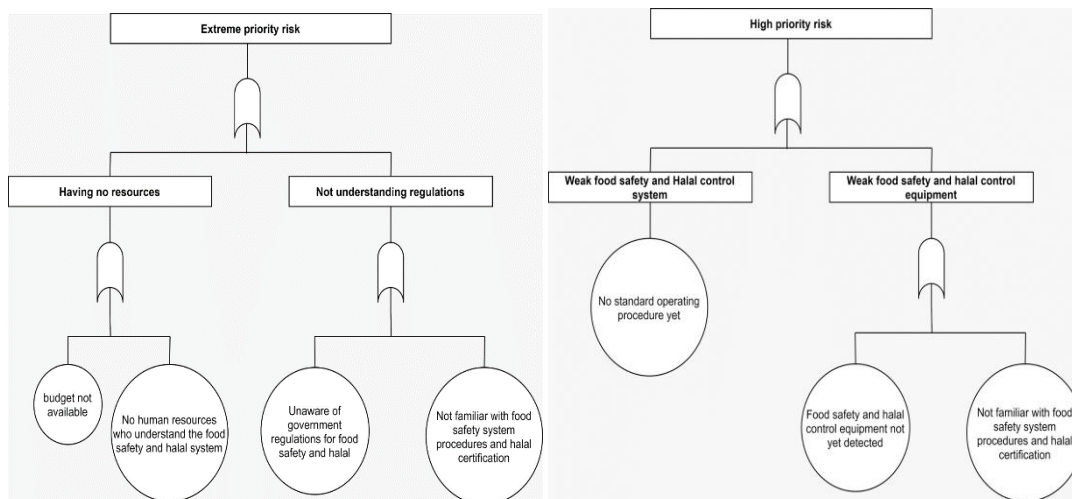

Figure 2. Meat Industry Risk Analysis with FTA

Figure 2 shows the root causes of beef supply chain risk. These root causes need to be addressed. Therefore, to increase effectiveness and efficiency in minimizing risks in the beef supply chain, technology needs to be used. One form of technology that is currently being

developed to minimize risk is blockchain technology. Furthermore, based on these results, a blockchain technology model is designed to maintain beef conformity based on food safety and halal standards as follows:

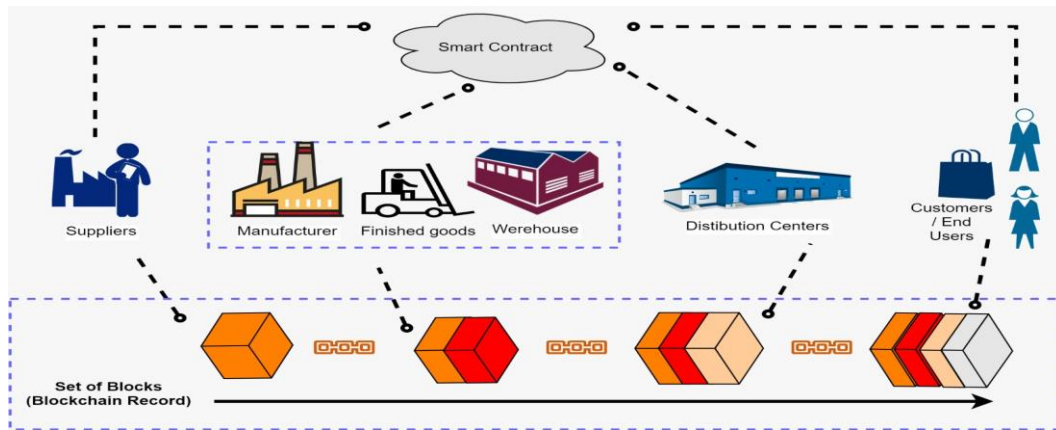

Figure 3. Design Blockchain Technology for Beef Supply Chain

Blockchain technology in mitigating food safety and halal risks in the beef supply chain (Figure 3), especially to minimize risks at the extreme priority and high priority risk levels can be done in the form of:

1. Development of a data traceability system

Data traceability systems with blockchain technology in the supply chain make it possible to develop and implement decentralized, immutable, transparent, and reliable systems, where process automation facilitates real-time data monitoring and decision-making activities. Moreover, the development of data traceability systems with blockchain technology enables visibility and fulfills consumers' needs for transparency and quality assurance.

2. Smart contracts

Smart contracts based on blockchain technology make it possible to establish cooperation with trading partners by automating contract execution and reducing the role of intermediaries. Through this smart contract, the relationship between actors in

1 the meat industry supply chain can be carried out effectively, efficiently, and securely.

2
3 The positive impact of using smart contracts is cost and time savings, ensuring data
4 security, openness, trust, and increasing speed. This has been proven by the use of smart
5 contracts in various fields, such as health, real estate, insurance, energy management,
6 and transportation in the development of smart cities.
7
8

9 3. Improving data management

10 Blockchain offers excellent data security and integrity, though methods like encryption
11 help combat data breaches. Blockchain technology helps organizations by providing
12 better protection against data breaches, using hashing techniques to store data securely,
13 which helps the company secure data and also helps in data sharing. The primary
14 characteristic of blockchain is decentralization, which allows easy and secure data
15 exchange between organizations.
16
17

18 4. Improving system management supply chain.

19 Blockchain technology makes it easier for stakeholders to track and trace products,
20 which can improve supply chain traceability. This can lessen waste, stop fraud, and
21 boost productivity (Bhatt et al., 2013). Blockchain technology offers a decentralized,
22 safe platform for data sharing and storing, which can enhance data management in the
23 supply chain. This can increase efficiency and transparency while preventing data
24 breaches and loss (Hu & Ghadimi, 2022).

30 **CONCLUSION**

31 The implementation of blockchain technology in the beef industry supply chain can increase
32 transparency and accountability, reduce the possibility of fraud, and enable better tracking of
33 the origin and halal status of beef products. Blockchain technology can also help ensure that
34 beef products meet food safety and halal standards set by regulatory authorities and religious
35 norms. Contamination or diseases that may endanger consumer health can be tracked quickly

1 and accurately through blockchain technology. Blockchain technology can help with halal
2 and food safety risk management in the beef industry. It will make it easier to find and
3
4 and eliminate potential problems. With this research, data, and transaction flows will be easier to
5
6 track, more transparent, and more secure to be used as part of the control and supervision
7
8 system for food safety and halal standards in the beef supply chain. The implication of this
9
10 research is transparency in the supply chain, the accuracy of product records, prevention of
11
12 food poisoning, improving halal compliance, risk management and thus increasing consumer
13
14 confidence.

20 21 **ACKNOWLEDGEMENTS**

22
23 I would like to express my sincere gratitude to the Ministry of Education, Culture, Research,
24 and Technology for the generous funding and support for the research project called
25
26 "Blockchain Technology Design Based on Food Safety and Halal Risk Analysis in the Beef
27
28 Supply Chain with FMEA-FTA." We now have a better grasp of food safety and halal risk
29
30 management in the supply chain for beef thanks to your involvement. We have been able to
31
32 investigate cutting-edge blockchain-based safety and compliance solutions thanks to your
33
34 assistance. Again, I want to thank you for your tremendous help. Your dedication to science
35
36 and technology is having a big influence, and we are very appreciative of the chance to help
37
38 with these crucial developments.

ABSTRACT

Beef has an important role in the health of the body. Food safety and halal are the main factors for consumers in purchasing beef. However, in reality, several activities in the beef supply chain result in status changes to be unsafe and not halal for consumption. This occurs due to weak food safety and halal supervision in the beef supply chain system. Therefore, this study proposes the use of blockchain technology to strengthen the food safety and halal supervision system in the beef supply chain. The objectives of this study are (1) to identify food safety and halal risk factors, and (2) to develop a blockchain technology design for mitigating food safety and halal risks in the beef supply chain. This research uses the FMEA method to measure risks and FTA for risk analysis. The results showed that 30 risks were identified in the beef supply chain. The highest risk is the absence of a halal certificate on the product. The 30 risks are grouped into 4 risks that are included in extreme priority risk, 11 risks in high priority risk, 4 risks in moderate risk, and 11 risks as acceptable risk. Based on these results, the role of blockchain technology to minimize risk is in the flow of data, and transactions will be easier to track, more transparent, and safer to use as part of the control and supervision system for food safety and halal standards in the beef supply chain. This research has implications for transparency in the supply chain, the accuracy of product track records, prevention of food poisoning, improving halal compliance, risk management and thus increasing consumer confidence.

Keywords: Halal, food safety, beef supply chain, blockchain technology

INTRODUCTION

The beef industry plays an important role in the global food supply chain. This is because beef, as a ruminant commodity, is a source of protein that influences the development of human health. As the world's population increases, a 76% increase in global meat consumption is expected between 2015 and 2025 (Thomas et al., 2021). In its development, consumer demand for beef is not only related to the amount needed but also to the fulfillment of food safety and halal standards. Food safety and halal are important aspects to ensure that the beef consumed is safe, and follows Islamic law. Fulfillment of these two things is a major consideration for consumers in choosing food for health reasons and compliance with values in Islam (Hana Catur Wahyuni et al., 2020). Food safety standards regulated through national and international policies are an important component of preparing food that is safe for consumption, avoiding potential chemical, biological, and physical risks that can endanger the health of the consumer's body (Liu et al., 2022). Halal is an obligation for adherents of Islam for all products consumed, under the provisions in the Quran and Hadith (Fuseini et al., 2016) (Khan et al., 2018).

However, some phenomena indicate that there are activities that result in food safety and halal contamination in the beef industry supply chain. This happens because the beef industry supply chain is more complex than other food industries. Food safety and halal contamination in the beef industry supply chain results in unsafe and un-halal food for consumption. Food safety contamination can come from the use of raw materials that contain harmful enzymes and ethanol (Ermis, 2017), working mechanism in the production room and product storage (Britton et al., 2021), suppliers, distributors, and retailers (H.C. Wahyuni et al., 2018). Halal contamination can come from cross-contamination with halal and non-halal products in warehouses, logistics, equipment used, or production areas that are not separate for halal and non-halal products, the use of raw materials, or additives that have not been certified.

1 Assurance of the fulfillment of food safety and halal standards is carried out by
2
3 avoiding the occurrence of such contamination through the implementation of risk
4
5 management. In various studies, it has been proven that risk management can identify and
6
7 manage risks and develop risk mitigation actions to formulate areas of improvement in
8
9 reducing hazards in the supply chain to improve company performance (Minguito & Banluta,
10
11 2023). Specifically in the case of food supply chains, previous research suggests that risk
12
13 management has a positive impact on environmental health through cooperation between
14
15 suppliers and customers in terms of design, purchasing, production, packaging, and the use of
16
17 green energy (El Ayoubi & Radmehr, 2023).
18
19
20
21

22 However, in reality, there are problems in the meat supply chain as one of the ruminant
23
24 commodities related to the implementation of food safety and halal standards and have an
25
26 impact on the risk of changing the status of food to be unsafe and not halal. Lack of information
27
28 in the beef supply chain, especially related to the health of livestock (cattle), processing and
29
30 slaughtering, transport, and storage systems are potential sources of contamination so that
31
32 products become unsafe and not halal for consumption. This situation is exacerbated by the
33
34 absence of adequate facilities in the Halal meat supply chain, particularly in terms of
35
36 slaughterhouses. In Indonesia, as of 2022, fewer than 15% of slaughterhouses possess Halal
37
38 certification, despite their crucial role in ensuring the production of Halal meat (IHATEC,
39
40 2023)
41
42
43
44

45 Therefore, implementing risk management in the beef supply chain to comply with
46
47 food safety and halal standards requires cooperation between actors in a holistic and integrated
48
49 manner by utilizing technology. Blockchain technology is the best option that can be used in
50
51 risk management in the beef supply chain to meet food safety and halal standards because it
52
53 can guarantee resilience, transparency, and accountability in the risk management decision-
54
55 making process to respond to uncertain and complex events to support the improvement of
56
57 supply chain performance (Chowdhury et al., 2023; Hu & Ghadimi, 2022; Sheel & Nath,
58
59
60
61
62
63
64
65

2019).

This research offers a novelty in the form of a blockchain technology model following food safety and halal standards in the beef supply chain. This research is important to overcome the weak control and supervision system of food safety and halal standards in the beef supply chain. With the results of this research, the flow of data and transaction information will be more effective and efficient to be traced, transparent, and secured as a source of control and supervision system for food safety and halal standards in the beef supply chain. With this technology, it is expected that the availability of beef that meets food safety and halal standards can be guaranteed, thereby reducing the value of imports as has been the case. Based on this description, the research objectives are: (1) identify risk factors for food safety and halal, (2) Develop a blockchain technology design for mitigating food safety and halal risks in beef.

BLOCKCHAIN TECHNOLOGY

Blockchain technology represents a method of digitalizing contracts, transactions, and records, exerting an impact on global economic, social, political, and legal systems (Tripathi et al., 2023). Theoretical inquiries into the implications of incorporating blockchain technology into the food supply chain have been ongoing since 2018. These investigations encompass various aspects such as technological assessment, sustainability of the food supply chain, and sales model selection (Akram et al., 2024; Köhler & Pizzol, 2020; Y. Liu et al., 2021; Saurabh & Dey, 2021). Previous research on risks within the food supply chain has primarily focused on the areas of tracking, tracing, and authentication (Sugandh et al., 2023). Significantly, there exists a void in the existing literature concerning the utilization of blockchain technology in addressing food safety concerns, specifically in conducting Halal risk analysis within the beef supply chain. Hence, the primary objective of this research is to bridge this gap by investigating and discussing these particular aspects.

FOOD SAFETY

Food safety means keeping food from becoming contaminated, spoiled, or other health

1 threats during production, processing, distribution, storage, and consumption. Food safety is
2
3 becoming a topic of increasing interest, and in recent years, research on the subject has grown
4
5 rapidly (Kuai, 2023). Chemical and microbial contamination, adulteration, mislabelling, and
6
7 expired food are some of the food safety hazards that occur in food markets (Gizaw, 2019).
8
9 One important measure to stop foodborne illness is food safety inspections, which have been
10
11 criticized for being inconsistent and not adequately solving the problem (Barnes et al., 2022).
12
13 Deliberate food crime, which covers a wide range of types and levels of financial gain, requires
14
15 robust risk assessment and countermeasure tools (Manning & Soon, 2016). In this context, the
16
17 utilization of blockchain technology enables the direct monitoring of food safety from its point
18
19 of origin throughout every stage of the supply chain until it reaches the end consumer. This
20
21 monitoring capability enhances credibility, efficiency, and overall safety (Patel et al., 2023) of
22
23 Halal food products.
24
25
26
27
28

29 **HALAL**

30
31 "Halal" is an Arabic term that means "permissible" or "sharia-compliant". In food and
32
33 beverages, the term is used to refer to items or ingredients that are permitted or halal for
34
35 consumption by Muslims. The rejection of alcohol and pork, as well as certain slaughtering
36
37 techniques, are some examples of the differences between halal and non-halal food (Jia &
38
39 Chaozhi, 2021). In Islam, the consumption of pork, carrion, blood, all blood derivatives,
40
41 alcohol, and all ingredients that are considered haram or impermissible is prohibited.
42
43 Conversely, foods that do not contain these ingredients are called halal (Karahalil, 2020). To
44
45 compete in the global Halal market, investment in Halal food production in developing
46
47 countries and non-Muslim countries requires the adoption of complex and advanced food
48
49 technologies (Mahama et al., 2020).
50
51
52
53
54

55
56 The adoption of the Halal supply chain provenance is essential to ensure and certify
57
58 the Halal status and integrity of products, thus preventing contamination (Kurniawati &
59
60 Cakravastia, 2023). The application of the Halal supply chain has extended to various sectors,
61
62
63
64
65

1 including the food industry in Malaysia (Ab Rashid & Bojei, 2019; Mohamed et al., 2020),
2
3 subsectors such as frozen food (Kristanto & Kurniawati, 2023), and considerations related to
4
5 Halal integrity (Ali & Suleiman, 2018).
6
7

8 Aligning with this study, previous research has explored the themes of halal integrity
9
10 and contamination risks within the Halal supply chain. However, there is a need for a more
11
12 detailed examination of the sources of these risks and the introduction of mitigation strategies,
13
14 leveraging technologies such as blockchain. This research brings a novel contribution by
15
16 focusing on risk mitigation through the utilization of blockchain technology, grounded in the
17
18 identification of risk sources associated with each participant in the supply chain
19
20

21 **RISK ANALYSIS**

22
23 Risk analysis is a systematic process for identifying, assessing, and managing potential
24
25 risks or uncertainties that may affect the achievement of project objectives, business decisions,
26
27 or other activities. Risk analysis is used in the field of occupational health and safety to identify
28
29 and control risks in laboratory research. This includes training, creating emergency plans, and
30
31 ensuring the proper use and storage of chemicals (KARAHAN & AYDOĞMUŞ, 2023).
32
33
34
35

36 **BEEF SUPPLY CHAIN**

37
38 The beef supply chain involves the flow of products, financial transactions, and
39
40 information among the various actors involved. Highly technical, professional, and
41
42 competitive livestock production, mainly based on quality and technology, will lead to global
43
44 progress in the supply chain (Malafaia et al., 2021). Supply chain governance encompasses
45
46 the rules, regulations, and organizations that govern the supply chain to achieve various
47
48 objectives, including environmental objectives, to maintain the sustainability of the industry
49
50
51 (Chamanara et al., 2023).
52
53

54 **FMEA**

55
56 A systematic method known as FMEA (Failure Mode and Effect Analysis) is used to identify,
57
58 evaluate, and manage possible failures in a process or product. FMEA uses expert data to
59
60
61
62
63
64
65

1 determine the risk of failure modes (Emovon & Mgbemena, 2019). In industries such as
2 manufacturing, healthcare, and aerospace, FMEA is commonly used to improve product
3 quality, reliability, and safety. The FMEA process includes identifying potential failure modes,
4 determining their causes and effects, and assigning a risk priority number (RPN) to each failure
5 mode based on severity, occurrence, and detectability (Zhou et al., 2022). The RPN is
6 calculated by multiplying the severity, occurrence, and detectability scores for each failure
7 mode. A higher RPN score indicates that the failure mode poses a greater risk. FMEA can be
8 used independently or in combination with root cause analysis (RCA) and fault stem analysis
9 (FTA) to improve the reliability and safety of a system or product (Ouyang et al., 2022).

22 **FAULT TREE ANALYSIS (FTA)**

24 A graphical and analytical tool called Fault Tree Analysis (FTA) is used to evaluate potential
25 causes of system failure. This tool is commonly used in many fields, such as engineering,
26 safety, and risk management. FTA starts with a critical event, such as a system failure, and
27 then identifies all the factors that could have contributed to the event. A tree-like structure
28 shows these causes, with the main event at the top of the tree and potential causes branching
29 out below it. To improve the efficiency of recursive failure analysis, FTA is often used in
30 conjunction with other methods such as FMEA (Failure Mode and Effects Analysis) (Peeters
31 et al., 2018). FTA also uses fuzzy logic and ontology-based approaches to perform
32 comprehensive analyses that are based on rich domain knowledge and in a fuzzy environment
33 (Akyuz et al., 2020). FTA can help find and prioritize risks and create safety protocols to
34 prevent or mitigate failures (Pan et al., 2022).

52 **METHODS**

54 This research was conducted on the beef supply chain in East Java, Indonesia. The structures
55 involved in the beef supply chain are farmers as cattle suppliers, beef processing companies,
56
57
58
59
60
61
62
63
64
65

transporters, and distributors/retailers. The stages of research implementation were carried out in the following stages:

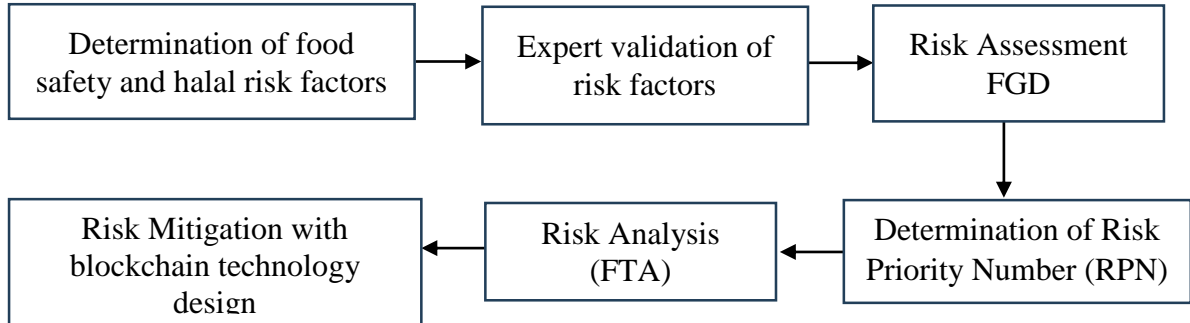

Figure 1: Research Stages

By conducting semi-structured interviews with purposively selected experts representing various stages of the beef supply chain, including cattle farmers, processing companies, and distributors, the researchers identified several risks related to both food safety and adherence to Halal standards. The validation and risk assessment processes, as well as their subsequent formulation, were significantly shaped by insights from these seven experts, encompassing academia, practitioners, and government officials.

Table 1. Risk factors on food safety and halal in the beef supply chain

Supply Chain Actors	Risk Factor	Risk Code
Supplier	No animal health data yet	R1
	Transmission of disease from cattle to humans	R2
	Physical damage	R3
	Foreign body contamination such as glass, plastic, or metal	R4
	Residual drug or chemical content	R5
	Chemical or heavy metal contamination	R6
	Unhygienic storage	R7
	Unhygienic transport	R8
	No traceability of animal origin	R9
	Misinformation	R10
	Does not have a halal certificate	R11
	The process of slaughtering cattle does not follow Islamic law	R12
	Cross-contamination with non-halal meat in storage or transport	R13

Production System	Cross-contamination of equipment used with non-halal products	R14
	Contamination using unhygienic equipment	R15
	Use of food additives that are not halal-certified	R16
	Use of food additives or preservatives that are not suitable for human health	R17
	Production room temperature is not up to standard	R18
	Products not yet halal-certified	R19
	Physical contamination of product packaging	R20
Distribution System	The storage warehouse is not halal-certified	R21
	Cross-contamination with non-halal products	R22
	Use of unhygienic modes of transport	R23
	No temperature control during the transport process	R24
	Storage room temperature is not suitable	R25
	Cross-contamination with other products in the storage room	R26
	Subscription of unhygienic products	R27
	Subscription of halal-contaminated products	R28
No record of product expiry yet	R29	
There is no inspection of the halal status of the product	R30	

This activity is carried out by experts by filling out a questionnaire based on aspects, namely: O (Occurance), S (Severity), and D (Detection). Occurrence indicates the frequency of errors or failures. Severity indicates the severity of the impact of an error/failure. Detection describes the effectiveness of the detection system to detect errors or failures that will occur. This assessment refers to the mechanism in the FMEA (Failure Mode Effect Analysis) method (Salah et al., 2023). The RPN value is obtained based on the following equation:

$$RPN = S \times O \times D$$

The RPN value is then classified into priority levels as in the following (Haider et al., 2021). The higher the RPN value, the higher the risk level for that factor so it becomes a priority that must be mitigated. Risk prioritization is done by arranging the RPN values from highest to lowest as the first to last priority. S, O, and D risk assessments were conducted by experts through FGDs. In the FGD, all experts discussed and agreed to provide an assessment as shown in Table 4 below:

Table 2. Supply Chain Risk Assessment

Actors	Risk	S	O	D	RPN	Risk Priority Level
Supplier	R13	3	2	5	30	Acceptable risk
	R10	3	5	3	45	Acceptable risk
	R3	3	4	7	84	Acceptable risk
	R4	7	2	7	98	Acceptable risk
	R5	7	2	8	112	Acceptable risk
	R6	7	3	6	126	Acceptable risk
	R12	7	4	5	140	Acceptable risk
	R9	5	6	3	150	Moderate priority risk
	R2	7	4	6	168	Moderate priority risk
	R7	6	6	7	252	High priority risk
	R1	6	7	7	294	High priority risk
R8	7	7	8	392	High priority risk	
R11	8	7	8	448	Extreme priority risk	
Production system	R20	3	3	6	54	Acceptable risk
	R14	7	3	7	147	Acceptable risk
	R18	8	3	8	192	Moderate priority risk
	R15	7	5	8	280	High priority risk
	R17	5	8	8	320	High priority risk
	R16	6	8	8	384	High priority risk
	R19	8	8	8	512	Extreme priority risk
Distribution system	R25	3	3	5	45	Acceptable risk
	R23	3	5	7	105	Acceptable risk
	R26	5	5	7	175	Moderate priority risk
	R24	6	6	7	252	High priority risk
	R27	6	6	7	252	High priority risk
	R28	8	4	8	256	High priority risk
	R22	7	6	8	336	High priority risk
	R29	8	6	8	384	High priority risk
	R30	7	8	9	504	Extreme priority risk
R21	8	8	8	512	Extreme priority risk	

Each RPN (table 1) value is classified into critical risk, high risk, moderate risk, and minor risk. Extreme priority risk is the most critical risk that affects the safe and halal status of beef. Therefore, the four risk factors must be further analyzed to obtain information about the root of the problem so that a solution can be formulated. In this study, risk analysis was carried out using FTA (Fault Tree Analysis). The FTA design in this study was prepared for extreme

priority risk and high priority risk levels. Moderate risk and acceptable risk levels can be controlled through corrective actions carried out periodically by utilizing existing resources.

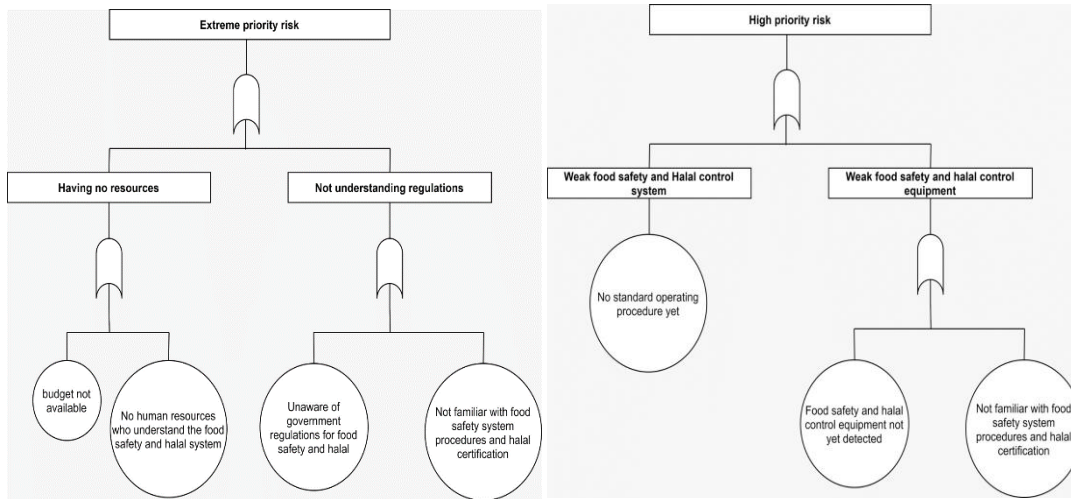

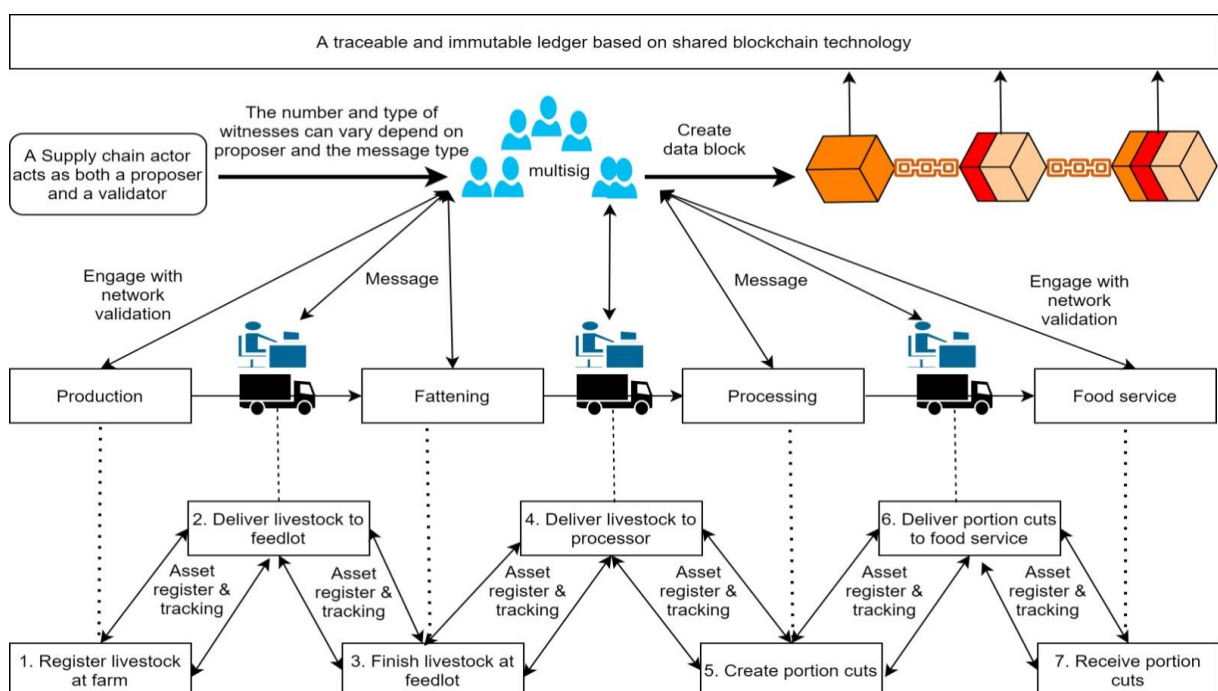

Figure 2. Meat Industry Risk Analysis with FTA

Figure 2 shows the root causes of beef supply chain risk. These root causes need to be addressed. Therefore, to increase effectiveness and efficiency in minimizing risks in the beef supply chain, technology needs to be used. One form of technology that is currently being developed to minimize risk is blockchain technology. Furthermore, based on these results, a

1 blockchain technology model is designed to maintain beef conformity based on food safety and
2
3
4 halal standards as follows:

5 6 **Figure 3. Design Blockchain Technology for Beef Supply Chain**

7
8 Figure 3 outlines the application of hybrid blockchain technology in managing the livestock
9 supply chain. The process initiates with livestock registration at the farm, followed by
10
11 continuous tracking during transportation to the feedlot, processing at the facility, to the
12
13 eventual distribution of meat cuts to food services. At each stage, secure data recording on the
14
15 blockchain ensures a traceable and unalterable trail. In this network, supply chain actors
16
17 function as proposers and validators, engaging in mutual validation, often employing multi-
18
19 signature (multisig) systems to enhance security and transparency. This reflects the
20
21 collaborative efforts among various entities within the supply chain. A hybrid blockchain,
22
23 combining features of both public and private blockchains, enables organizations to establish a
24
25 permission-based private system alongside a permissionless public system. This setup allows
26
27 organizations to regulate access to specific data stored on the blockchain and determine which
28
29 data is accessible to the public.
30
31
32
33
34
35
36

37
38 Blockchain technology in mitigating food safety and halal risks in the beef supply chain
39
40 (Figure 3), especially to minimize risks at the extreme priority and high priority risk levels can
41
42 be done in the form of:
43
44

45 1. Development of a data traceability system

46
47 Data traceability systems with blockchain technology in the supply chain make it
48
49 possible to develop and implement decentralized, immutable, transparent, and reliable
50
51 systems, where process automation facilitates real-time data monitoring and decision-
52
53 making activities. Moreover, the development of data traceability systems with
54
55 blockchain technology enables visibility and fulfills consumers' needs for transparency
56
57 and quality assurance.
58
59
60
61
62
63
64
65

2. Smart contracts

Smart contracts based on blockchain technology make it possible to establish cooperation with trading partners by automating contract execution and reducing the role of intermediaries. Through this smart contract, the relationship between actors in the meat industry supply chain can be carried out effectively, efficiently, and securely. The positive impact of using smart contracts is cost and time savings, ensuring data security, openness, trust, and increasing speed. This has been proven by the use of smart contracts in various fields, such as health, real estate, insurance, energy management, and transportation in the development of smart cities.

3. Improving data management

Blockchain offers excellent data security and integrity, though methods like encryption help combat data breaches. Blockchain technology helps organizations by providing better protection against data breaches, using hashing techniques to store data securely, which helps the company secure data and also helps in data sharing. The primary characteristic of blockchain is decentralization, which allows easy and secure data exchange between organizations.

4. Improving system management supply chain.

Blockchain technology makes it easier for stakeholders to track and trace products, which can improve supply chain traceability. This can lessen waste, stop fraud, and boost productivity (Bhatt et al., 2013). Blockchain technology offers a decentralized, safe platform for data sharing and storing, which can enhance data management in the supply chain. This can increase efficiency and transparency while preventing data breaches and loss (Hu & Ghadimi, 2022).

CONCLUSION

The implementation of blockchain technology in the beef industry supply chain can increase

1 transparency and accountability, reduce the possibility of fraud, and enable better tracking of
2
3 the origin and halal status of beef products. Blockchain technology can also help ensure that
4
5 beef products meet food safety and halal standards set by regulatory authorities and religious
6
7 norms. Contamination or diseases that may endanger consumer health can be tracked quickly
8
9 and accurately through blockchain technology. Blockchain technology can help with halal
10
11 and food safety risk management in the beef industry. It will make it easier to find and
12
13 eliminate potential problems. With this research, data, and transaction flows will be easier to
14
15 track, more transparent, and more secure to be used as part of the control and supervision
16
17 system for food safety and halal standards in the beef supply chain. The implication of this
18
19 research is transparency in the supply chain, the accuracy of product records, prevention of
20
21 food poisoning, improving halal compliance, risk management and thus increasing consumer
22
23 confidence.

Blockchain Technology Design Based on Food Safety and Halal Risk Analysis in the Beef Supply Chain with FMEA-FTA

Dear Dr Wahyuni,

We have received the above referenced manuscript you submitted to Journal of Engineering Research.

It has been assigned the following manuscript number: JER-D-23-01939.

To track the status of your manuscript, please log in as an author at <https://www.editorialmanager.com/jer/>, and navigate to the "Submissions Being Processed" folder.
Thank you for submitting your work to this journal.

Kind regards,

Journal of Engineering Research

Subject: PDF for submission to Journal of Engineering Research requires approval

This is an automated message.

Blockchain Technology Design Based on Food Safety and Halal Risk Analysis in the Beef Supply Chain with FMEA-FTA

Dear Dr Wahyuni,

The PDF for your above referenced manuscript has been built and requires your approval. If you have already approved the PDF of your submission, this e-mail can be ignored.

Please review the PDF carefully, before approving it, to confirm it appears as you expect and is free of any errors. Once approved, no further changes can be made.

To approve the PDF, please:

* Log into Editorial Manager as an author at: <https://www.editorialmanager.com/jer/>.

* Click on the folder 'Submissions Waiting for Author's Approval' to view and approve your submission PDF. You may need to click on 'Action Links' to expand your Action Links menu.

* Confirm you have read and agree with Elsevier's Ethics in Publishing statement by ticking the relevant box.

Once the above steps are complete, you will receive an e-mail confirming receipt of your submission.

We look forward to receiving your approval.

Kind regards,
Journal of Engineering Research

Subject: Decision on submission to Journal of Engineering Research

Manuscript Number: JER-D-23-01939

Blockchain Technology Design Based on Food Safety and Halal Risk Analysis in the Beef Supply Chain with FMEA-FTA

Dear Dr Wahyuni,

Thank you for submitting your manuscript to Journal of Engineering Research.

I have completed my evaluation of your manuscript. The reviewers recommend reconsideration of your manuscript following major revision. I invite you to resubmit your manuscript after addressing the comments below. Please resubmit your revised manuscript by Feb 11, 2024.

When revising your manuscript, please consider all issues mentioned in the reviewers' comments carefully: please outline every change made in response to their comments and provide suitable rebuttals for any comments not addressed. Please note that your revised submission may need to be re-reviewed.

To submit your revised manuscript, please log in as an author at <https://www.editorialmanager.com/jer/>, and navigate to the "Submissions Needing Revision" folder.

Research Elements (optional)

This journal encourages you to share research objects - including your raw data, methods, protocols, software, hardware and more - which support your original research article in a Research Elements journal. Research Elements are open access, multidisciplinary, peer-reviewed journals which make the objects associated with your research more discoverable, trustworthy and promote replicability and reproducibility. As open access journals, there may be an Article Publishing Charge if your paper is accepted for publication. Find out more about the Research Elements journals at [https://www.elsevier.com/authors/tools-and-resources/research-elements-journals?](https://www.elsevier.com/authors/tools-and-resources/research-elements-journals?dgcid=ec_em_research_elements_email)

Journal of Engineering Research values your contribution and I look forward to receiving your revised manuscript.

Kind regards,
Jisha Sara
Assistant Managing Editor
Journal of Engineering Research

Editor and Reviewer comments:

Reviewer 1: I see the article contribute to the literature by implementing the FMEA analysis to measure the risks and FTA. Then the RPN is computed for every risk which is the novel part of this article. My comment would be only on why not mentioning references on the halal food supply chain using blockchain? I see a number of references study the same topic. You should revise the literature review part and highlight the gap in the research so you can define the research gap and your research scope very well to highlight your main contribution.

Reviewer 2: Firstly, I would like to commend you on the overall quality and clarity of your manuscript. Your approach to addressing the critical issue of food safety and halalness in the beef supply chain using blockchain technology is both timely and significant.

However, after a thorough review, I believe the paper could benefit from some minor and major revisions. Suggested revisions are as follows:

- 1- In the introduction, provide some statistics about the prevalence of the problems in halal beef supply chain. Convince the reader that the problem is relevant.
- 2- Elaborate on how you determined the risk factors in the first step of your methodology. The role of the experts was only to validate the risk factors; but you should expand on how you came up with the risks in the first place.
- 3- In table 2, sort the risks in descending order based on the RPN within each actor for better readability. Also make sure you fix the typo in the first column title "Aktor"
- 4- (MAJOR) You gave sufficient theoretical foundation regarding risk analysis tools which is good. However, there is a major lack of theoretical foundation and literature review about blockchain technology in food supply chain management in general, and in halal beef supply chain in particular. If there's a gap in the literature regarding halal beef SC, then you should highlight it. Otherwise, you should outline what others have done in this area and how your work will contribute to the literature.
- 5- (MAJOR) While you have thoroughly identified the risk factors in halal beef supply chains, the paper requires a more

in-depth exploration of the specific blockchain architecture proposed. Details such as the type of blockchain (public/private/hybrid), consensus mechanisms, and data storage strategies would be invaluable. This technical depth is essential for assessing the feasibility and practical implementation of your proposal.

In conclusion, the paper tackles a really interesting and pertinent subject. The changes suggested above are meant to strengthen your points, making your study more all-encompassing, and useful in real-world scenarios.

Jisha Sara
Assistant Managing Editor
Journal of Engineering Research

Editor and Reviewer comments:

Reviewer 2: All the comments have been addressed (minor and major). Some background and literature review about blockchain technology in food SC is now given. More details about the proposed blockchain architecture are also given.

One minor comment is remaining, however. You need to give a source for the newly added statistic about the percentage of slaughterhouses that possess Halal certification.

Dear Dr Wahyuni,

Thank you for submitting your manuscript to Journal of Engineering Research.

I am pleased to inform you that your manuscript has been accepted for publication.

My comments, and any reviewer comments, are below.

Your accepted manuscript will now be transferred to our production department. We will create a proof which you will be asked to check, and you will also be asked to complete a number of online forms required for publication. If we need additional information from you during the production process, we will contact you directly.

We appreciate and value your contribution to Journal of Engineering Research. We regularly invite authors of recently published manuscript to participate in the peer review process. If you were not already part of the journal's reviewer pool, you have now been added to it.

We encourage authors of original research papers to share the research objects – including raw data, methods, protocols, software, hardware and other outputs – associated with their paper. More information on how our open access Research Elements journals can help you do this is available at https://www.elsevier.com/authors/tools-and-resources/research-elements-journals?dgcid=ec_em_research_elements_email.

We look forward to your continued participation in our journal, and we hope you will consider us again for future submissions.

Kind regards,
Jisha Sara
Assistant Managing Editor
Journal of Engineering Research
