Title: The elementary students' perceptions upon augmented reality: A cross-sectional study

Journal: Heliyon

Dear Mr Amir,

We have now received all of the reviewers' comments on your recent submission to Heliyon.

The reviewers have advised that your manuscript should become suitable for publication in our journal after appropriate revisions.

If you are able to address the reviewers' comments, which you can find below, I would like to invite you to revise and resubmit your manuscript. Please note that Heliyon focuses on technically correct science and you are only expected to include revisions that are necessary to ensure that the content and the conclusions of the research are technically correct.

We ask that you respond to each reviewer comment by either outlining how the criticism was addressed in the revised manuscript or by providing a rebuttal to the criticism. This should be carried out in a point-by-point fashion as illustrated here: <https://www.cell.com/heliyon/guide-for-authors#Revisions>

To allow the editors and reviewers to easily assess your revised manuscript, we also ask that you upload a version of your manuscript highlighting any revisions made. You may wish to use Microsoft Word's Track Changes tool or, for LaTeX files, the latexdiff Perl script (<https://ctan.org/pkg/latexdiff>).

To submit your revised manuscript, please log in as an author at <https://www.editorialmanager.com/heliyon/>, and navigate to the "Submissions Needing Revision" folder under the Author Main Menu.

I look forward to receiving **your** revised manuscript.

Kind regards,

Cathryn Magno, PhD

Associate Editor - Education

Heliyon

Editor and Reviewer **comments**:

Reviewer #1: This paper proposes to perform a cross study on elementary students' perceptions upon augmented reality. However, the article is not well written. English needs to be proof read by a native speaker. Introduction and Literature review part is quite weak; the contribution of the article and the comparison with existing approaches is not comprehensive enough. For example, how do you compare with a **recent** article to apply mixed reality for comprehending product design:

Tang, YM, Au, KM, & Leung, Y. (2018). Comprehending products with mixed reality: Geometric relationships and creativity. International Journal of Engineering Business Management. <https://doi.org/10.1177/1847979018809599>

The scientific content is quite weak. Not only due to the article demonstrating the use of a very simple AR demonstration for experiment, the experimental results and analysis are preliminary. I am wondering how this AR demonstration can be related to geometry relationship. And how it can be proved from the experimental results. The experimental results only show some qualitative **comments**. The statistical findings are also descriptive and quite subjective.

The last but not least, what are the implications and insights of the current study? Seems it is still not well addressed.

Reviewer #2: I found the methods adequate. The literature review could be improved and extended, but I found it enough for the purpose of the paper. The results are well explained and the authors findings will reinforce the idea that augmented reality applications should improve the students' perceptions and the spatial abilities. Overall, the aims of the study are consistent and the discussion, interpretation and conclusion are adequate.

Reviewer #3: It would be much better if the final goals of the AR education system are precisely described in the paper (in the introduction session). The roles of the research, which aims to investigate "perception" of the elementary school students, should also be specified in terms of the final goals of the education system. It is not clear why the study of the "perception" of the students is required, how the results are utilized, etc. The questions used in the study are vague and guides questions. By asking such questions in the manuscript, it must be quite hard to see if the students liked the AR education because of the new technology, AR, itself or the education contents. Though the results are "positive", it does not necessarily mean the AR education works. The students may like to play with the AR technology itself. The AR education must aim to make the students understand geometry well and hopefully get more interests. It would be better if the questions were focused on the education contents and more specific to the geometry subject. Another way to see if the students like the AR-based education is to observe the behaviors of the students while they learn geometry using the AR technology. When do the students show their interests? Which part works well while the other parts do not? Would it be better if the students are guided by their instructors? They may share the AR education system and get more explanations. Would it be showing much better results? What about making the students get real touch feelings? Would it be more effective to understand spatial knowledge and/or skills? It is required to explain the following terms in detail: 3Dmetric (page 2 line 27), HTL (page 6 line 17) and LCM (page 6 line 24).

Reviewer #4: Methods:

Since the number of respondents is quite low (only 36 students), explain in more detail, how the authors deal with these data and the analysis technique (quantitative method). Did the study employ Nonparametric statistics? How to ensure the data normally distributed?

Data collection procedures should be put in a specific subchapter.

Please explain the interrater reliability score when mentioning 'consensus during data analysis'.

Mention the name of the survey or questionnaire used in the study? Is it an original questionnaire? Please elaborate the validity information of the questionnaire (e.g., content validity, face validity).

Explain or mention the interview protocol.

Is there any specific reason choosing the school or targeted respondents? Since this study related to augmented reality, is there any ICT literacy assessment to better understand the background of the students?

Results:

Enhance the explanation when discussing the results gathered from survey and interview compare or synthesize the data gathered from different sources).

Interpretation:

Good.

Other **comments**:

The Abstract can be improved by providing rationales of the study at the beginning (could be more elaborative)

Avoid putting table or image at the beginning of subchapter; put the table after writing a paragraph or below the paragraph that refers to the table or image.

Explain the limitations of the study and further work from the study.
